Received 21 September 2011; accepted 10 October 2011

Key indicators: single-crystal X-ray study;  $T = 200$  K; mean  $\sigma(\text{C}-\text{C}) = 0.002$  Å; disorder in main residue;  $R$  factor = 0.045;  $wR$  factor = 0.130; data-to-parameter ratio = 17.7.

The title compound (also known as 9-hydroxyrisperidone),  $\text{C}_{23}\text{H}_{27}\text{FN}_4\text{O}_3$ , is a heterocyclic compound with manifold pharmacological properties. The hydroxy group shows disorder over two positions, with site-occupancy factors of 0.856 (2) and 0.144 (2). The piperidine ring adopts a chair conformation, while the annulated ring bearing the hydroxy group is present in a half-chair conformation. Classical  $\text{O}-\text{H}\cdots\text{O}$  hydrogen bonds as well as  $\text{C}-\text{H}\cdots\text{N}$  contacts connect the molecules into undulating sheets lying perpendicular to the crystallographic  $b$  axis. The shortest centroid-centroid distance between two centers of gravity is 3.5867 (8) Å and is apparent between the benzoxazole moiety and the six-membered ring bearing the keto substituent.

**S1. Comment**

Paliperidone, or 9-hydroxyrisperidone, is one of the most recently available atypical antipsychotics (Spina & Crupi, 2011). It is a benzisoxazole derivative and the major active metabolite of risperidone, a widely used atypical antipsychotic approved for the treatment of schizophrenia and other psychiatric disorders. The pharmacokinetics of paliperidone *versus* risperidone have been published (de Leon *et al.*, 2010). Related crystal structures, *viz.* 3-{2-[4-(6-fluoro-1,2-benzisoxazol-3-yl)piperidino]ethyl}-6,7,8,9-tetrahydro-2-methyl-4*H*-pyrido[1,2-*a*]pyrimidin-4-one [risperidone] (Peeters *et al.*, 1993), risperidone *N*-oxide hydrogen peroxide methanol solvate (Ravikumar *et al.*, 2005), risperidone chloride 2.5 hydrate (Wang & Pan, 2006), 4-(6-fluoro-1,2-benzisoxazol-3-yl)-1-[2-(2-methyl-4-oxo-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-3-yl)ethyl]piperidinium nitrate (Sun & Zhang, 2009) have been reported. In view of the importance of the title compound we herein report its molecular and crystal structure.

The hydroxy group as well as the hydrogen atoms of the methyl group show disorder. While the hydroxy group is disordered over two defined positions with site occupancy factors of 0.856 (2) and 0.144 (2), rotational disorder is observed for the hydrogen atoms of the methyl group (occupancy ratio 0.68 (2) to 0.32 (2)). The low puckering amplitude of the six-membered ring bearing the keto group precludes a conformational analysis (Cremer & Pople, 1975). The piperidine ring is present in a <sup>1</sup>C<sub>4</sub> conformation (<sup>N3</sup>C<sub>C23</sub>) and the hydroxy-tetrahydropyrido ring annulated on the pyrimidin-4-one ring adopts a <sup>5</sup>H<sub>4</sub> conformation (<sup>C4</sup>H<sub>C3</sub>) (Fig. 1). Proton NMR spectra of dissolved crystals of the title compound do not indicate the presence of the two stereoisomers as became apparent upon modelling the disorder for the hydroxy group in an axial-equatorial configuration.

In the crystal, classical hydrogen bonds of the O–H...O type as well as C–H...N contacts whose range falls by 0.2 Å below the sum of van-der-Waals radii can be observed. While the classical hydrogen bonds are apparent between the hydroxy group as donor and the keto group as acceptor, the C–H...N contacts appear between one of the methylene groups of the central aza-cyclohexane moiety and the nitrogen atom of the oxazol subunit. In terms of graph-set analysis (Etter *et al.*, 1990; Bernstein *et al.*, 1995), the descriptor for the classical hydrogen bonds is C<sup>1</sup><sub>1</sub>(7) whereas the C–H...N contacts necessitate a C<sup>1</sup><sub>1</sub>(14) descriptor on the same level. In total, the molecules are connected to undulated sheets perpendicular to the crystallographic *b* axis. The shortest intercentroid distance between two centers of gravity was found at 3.5871 (8) Å and is observed between the oxazol subunit and the six-membered heterocycle bearing the keto-group (Fig. 2). Furthermore, a F...C<sub>g</sub> contact (*d*<sub>F...C<sub>g</sub></sub>: 3.2038 (12) Å) is observed between the fluorine atom and the six-membered ring bearing the keto group.

The packing of the title compound is shown in Figure 3.

## S2. Experimental

The title compound was obtained as a gift sample from Jubilant Life Sciences Ltd., Noida, India. Paliperidone was recrystallized from *N,N*-dimethylformamide by slow evaporation at room temperature.

## S3. Refinement

Four reflections, 1 0 4, -1 3 1, 0 4 4 and 0 1 1 were found to be obstructed by the beam stop and were omitted from the refinement. Carbon-bound H atoms were placed in calculated positions ( $C-H = 0.95 \text{ \AA}$  for aromatic carbon atoms and  $C-H = 0.99 \text{ \AA}$  for methylene groups) and were included in the refinement in the riding model approximation, with  $U(H)$  set to  $1.2U_{eq}(C)$ . The H atoms of the methyl groups were refined as rotationally disordered over two positions (orientations separated by  $60^\circ$  rotation of the H atoms) and allowed to rotate with a fixed angle around the  $C-C$  bond to best fit the experimental electron density and to account for rotational disorder (HFIX 127 in the *SHELX* program suite (Sheldrick, 2008)), with  $U(H)$  set to  $1.5U_{eq}(C)$ . Occupancies refined to 0.68 (2) and 0.32 (2). The H atom of the hydroxy group was allowed to rotate with a fixed angle around the  $C-O$  bond to best fit the experimental electron density (HFIX 147 in the *SHELX* program suite (Sheldrick, 2008)), with  $U(H)$  set to  $1.5U_{eq}(O)$ . The disorder of the hydroxy group was handled with a disorder model over two positions and site occupancy factors of 0.856 (2) and 0.144 (2). The anisotropic displacement parameters of the two oxygen atoms and of the two carbon atoms of the disordered group were each constrained to be identical. Equivalent bond distances in the disordered sections ( $C2-O1$  and  $C2b-O1b$ ,  $C1-C2$  and  $C1-C2b$ , and  $C2-C3$  and  $C2b-C3$ ) were restrained to be the same within a standard deviation of  $0.02 \text{ \AA}$ . Some minor residual electron density – that could not be resolved in any chemically meaningful way – remained.

#### Special details

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
