Received 7 November 2010; accepted 7 January 2011

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; R factor = 0.050; wR factor = 0.149; data-to-parameter ratio = 12.8.

The title compound, $\text{C}_{17}\text{H}_{11}\text{Cl}_3\text{O}$, was synthesized via the Vilsmeier–Haack reaction. The dihydronaphthalene ring system is non-planar, the dihedral angle between the two fused rings being $10.87(13)^\circ$; it forms a dihedral angle of $81.45(10)^\circ$ with the dichlorophenyl ring. The crystal structure features intermolecular $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds.

1-Chloro-4-(3,4-dichlorophenyl)-3,4-dihydronaphthalene-2-carbaldehyde

H. C. Devarajegowda, P. Nagendra, S. Jeyaseelan, N. Chidananda and B. Poojary

Comment

Recently drug candidates for blocking the monoamine reuptake transporters have considerable interest in the pharmaceutical industry for treatment of central nervous system disorders (Zhengxu *et al.*, 2007). 1,2,3,4-tetrahydronaphthalene derivatives are used for the treatment of central nervous system disorders (Jerussi *et al.*, 2004; Taber *et al.*, 2004). Tetrahydronaphthalene derivatives are also used in liquid crystal display elements (Ray *et al.*, 2003). Potent pharmaceutically active 1-chloro-4-(3,4-dichlorophenyl)-3,4-dihydronaphthalene-2-carbaldehyde was prepared by the Vilsmeier-Haack reaction (Vilsmeier *et al.*, 1937; Meth-Cohn *et al.*, 1991; Hurd *et al.*, 1941; Mallegol *et al.*, 2005) of 4-(3,4-dichlorophenyl)-3,4-dihydronaphthalen-1(2H)-one.

The asymmetric unit of the 1-chloro-4-(3,4-dichlorophenyl)-3,4-dihydronaphthalene-2-carbaldehyde contains one molecule (Fig. 1). The dihydronaphthalene ring system is non-planar; the dihedral angle between the two ring system of the naphthalene ring is 10.87 (13) $^{\circ}$ and also the dihedral angle between the dihydronaphthalene ring system and the dichlorophenyl ring is 81.45 (10) $^{\circ}$. The crystal structure shows intramolecular C5—H5 \cdots Cl1, C9—H9 \cdots Cl1, C15—H15B \cdots O4 and C18—H18 \cdots O4 intermolecular hydrogen bonds. Bond distances within the aromatic rings are in agreement with those observed related structures (Gowda *et al.*, 2008). The packing of the molecules shows when viewed along the a axis (Fig.2).

Experimental

To the Vilsmeier-Haack complex prepared from DMF and POCl₃ (0.03 mol) at 0°C, the compound 4-(3,4-dichlorophenyl)-3,4-dihydronaphthalen-1(2H)-one (0.01 mol) was added and the reaction mixture was stirred at 65°C for 4 h. The reaction completion was monitored by TLC. The contents were cooled, poured in to ice-cold water and neutralized using Na₂CO₃ solution. The product that separated was filtered and dried. X-ray quality crystals were obtained from an ethyl acetate solution.

Refinement

Hydrogen atoms were located in a difference Fourier map and were allowed to refine isotropically.

Refinement

Refinement on F^2 Primary atom site location: structure-invariant direct methods
 Least-squares matrix: full Secondary atom site location: difference Fourier map
 $R[F^2 > 2\sigma(F^2)] = 0.050$ Hydrogen site location: inferred from neighbouring sites
 $wR(F^2) = 0.149$ H atoms treated by a mixture of independent and constrained refinement
 $S = 1.09$ $w = 1/[\sigma^2(F_o^2) + (0.0885P)^2]$
 where $P = (F_o^2 + 2F_c^2)/3$
 3006 reflections $(\Delta/\sigma)_{\max} = 0.001$
 234 parameters $\Delta\rho_{\max} = 0.52 \text{ e \AA}^{-3}$
 0 restraints $\Delta\rho_{\min} = -0.33 \text{ e \AA}^{-3}$

Special details

Experimental. *CrysAlis PRO*, Oxford Diffraction Ltd., Version 1.171.33.55 (release 05–01–2010 CrysAlis171.NET) Empirical absorption correction using spherical harmonics, implemented in SCALE3 ABSPACK scaling algorithm.

^1H NMR (CDCl₃, 400 MHz): δ , 10.33 (s, 1H, -CHO), 6.92-8.00 (m, 7H, Ar-H), 4.13 (t, 1H, –CH proton of fused cyclohexane ring, J=10.0 Hz), 2.86-3.01(m, 2H, –CH₂ proton of fused cyclohexane ring)

IR (KBr, cm⁻¹): 3443.28 (-CHO), 1662.34 (C=O of aldehyde), 1595.81(C=C,aromatic), 838.883 (C-Cl), 1255.43 (C-H stretch).

FAB MASS: m/z = 337, mol. formulae: C₁₇H₁₁Cl₃O).

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.
