Received 15 January 2014; accepted 19 January 2014

Key indicators: single-crystal X-ray study; $T = 293$ K; mean $\sigma(\text{C}-\text{C}) = 0.003$ Å; R factor = 0.039; wR factor = 0.114; data-to-parameter ratio = 11.7.

In the title compound, $\text{C}_{14}\text{H}_{12}\text{N}_2\text{O}_5\text{S}$, the dihedral angle between the aromatic rings is $86.29(1)^\circ$ and the conformation between the $\text{C}=\text{O}$ bond of the amide group and the *meta*- NO_2 group is *syn*. The $\text{C}-\text{S}-\text{N}-\text{C}$ torsion angle is $-65.87(19)^\circ$ and the molecule has an L-shaped conformation. In the crystal, the molecules are connected into inversion dimers through pairs of $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonds and $\text{C}-\text{H}\cdots\text{O}$ interactions forming $R_2^2(8)$ and $R_2^2(14)$ loops, respectively. The dimers are connected by further $\text{C}-\text{H}\cdots\text{O}$ interactions, thereby forming (100) sheets.

N-(4-Methylphenylsulfonyl)-3-nitrobenzamide

S. Sreenivasa, M. S. Nanjundaswamy, A. G. Sudha, K. J. Pampa, N. K. Lokanath and P. A. Suchetan

S1. Introduction

As a part of our continued efforts to study the crystal structures of N-(aroyl)-arylsulfonamides (Suchetan *et al.*, 2010, 2011, 2012), we report here the crystal structure of the title compound (I) (Fig 1).

S2. Experimental

S2.1. Synthesis and crystallization

The title compound (I) was prepared by refluxing a mixture of 3-nitrobenzoic acid, 4-methylbenzenesulfonamide and phosphorous oxychloride (POCl_3) for 2 h on a water bath. The resultant mixture was cooled and poured into ice cold water. The solid obtained was filtered and washed thoroughly with water and then dissolved in sodium bicarbonate solution. The compound was later reprecipitated by acidifying the filtered solution with dilute HCl. The compound obtained was filtered and later dried (Melting point: 459 K).

Colorless prisms of (I) were obtained from a slow evaporation of its aqueous methanolic solution at room temperature.

S2.2. Refinement

The H atom of the NH group was located in a difference map and later refined freely. The other H atoms were positioned with idealized geometry using a riding model with C—H = 0.93–0.96 Å. All H atoms were refined with isotropic displacement parameters (set to 1.2–1.5 times of the U_{eq} of the parent atom).

S3. Results and discussion

In I, the dihedral angle between the two aromatic rings is 86.29 (1)°. Compared to this, the dihedral angle is 79.4 (1)° in N-(4-methylphenylsulfonyl)-benzamide (II) (Suchetan *et al.*, 2010), 89.8 (1)° in N-(4-methylphenylsulfonyl)-4-nitrobenzamide (III) (Suchetan *et al.*, 2011) and 86.9 (2)° in N-(phenylsulfonyl)-3-nitrobenzamide (IV) (Suchetan *et al.*, 2012). Thus, introducing a nitro group into the benzoyl ring results in an increase of the dihedral angle between the aromatic rings. The conformation between the N—H bond and the *meta*-NO₂ group is *anti* in contrast to the *syn* conformation observed in IV (Suchetan *et al.*, 2012). The molecule is twisted at the S atom, the dihedral angle between the planes defined by the S—N—C=O segment in the central chain and the sulfonyl benzene rings being 79.16 (1)°.

In the crystal structure, the molecules are connected into inversion dimers through N1—HN1 \cdots O2 hydrogen bonds (Table 1, Figure 2) and C13—H13 \cdots O2 interactions forming R₂²(8) and R₂²(14) ring motifs respectively. These dimers are further connected into C(12) chains through C3—H3 \cdots O4 interactions forming sheets (Figure 2).

Data collection

Bruker APEXII diffractometer	2378 independent reflections
Radiation source: fine-focus sealed tube	2053 reflections with $I > 2\sigma(I)$
Graphite monochromator	$R_{\text{int}} = 0.035$
phi and φ scans	$\theta_{\text{max}} = 64.5^\circ$, $\theta_{\text{min}} = 3.8^\circ$
Absorption correction: multi-scan (SADABS; Bruker, 2009)	$h = -5 \rightarrow 4$
$T_{\text{min}} = 0.481$, $T_{\text{max}} = 0.638$	$k = -26 \rightarrow 26$
12115 measured reflections	$l = -14 \rightarrow 14$
	2 standard reflections every 1 reflections
	intensity decay: 1%

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.039$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.114$	$w = 1/[\sigma^2(F_o^2) + (0.0621P)^2 + 0.3691P]$
$S = 1.06$	where $P = (F_o^2 + 2F_c^2)/3$
2378 reflections	$(\Delta/\sigma)_{\text{max}} < 0.001$
204 parameters	$\Delta\rho_{\text{max}} = 0.20 \text{ e } \text{\AA}^{-3}$
0 restraints	$\Delta\rho_{\text{min}} = -0.23 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	

Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
