Received 27 June 2010; accepted 11 July 2010

Key indicators: single-crystal X-ray study; $T = 100$ K; mean $\sigma(\text{C}-\text{C}) = 0.003$ Å; R factor = 0.035; wR factor = 0.102; data-to-parameter ratio = 8.7.

In the title compound, $\text{C}_{17}\text{H}_{16}\text{N}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$, the dihedral angle between the mean planes of the benzene and benzimidazole systems is $26.2(3)^\circ$. These groups are slightly twisted around the ethoxymethane unit [$\text{C}-\text{C}-\text{O}-\text{C}$ torsion angle = $177.64(15)^\circ$]. The crystal packing is stabilized by $\text{N}-\text{H} \cdots \text{O}$, $\text{O}-\text{H} \cdots \text{N}$ and $\text{O}-\text{H} \cdots \text{O}$ hydrogen-bond interactions involving the water molecules. Weak $\pi-\pi$ stacking interactions [centroid-centroid distances = $3.7943(7)$, $3.6919(13)$ and $3.7533(14)$ Å] contribute to the molecular stability.

4-(1*H*-Benzimidazol-2-ylmethoxy)-3-ethoxybenzaldehyde trihydrate

Jerry P. Jasinski, Adam N. Braley, S. Samshuddin, B. Narayana and H. S. Yathirajan

S1. Comment

The benzimidazole ring system and its related compounds play an important role in pharmaceutical and agricultural fields due to their broad spectrum of biological activities (Pujar *et al.*, 1988, Bouwman *et al.*, 1990). The synthesis of novel benzimidazole derivatives remains a main focus of medicinal research. Benzimidazoles are useful as insecticides, acaricides, nematocides, herbicides and other plant-protective agents in the field of pest control (Madkour *et al.*, 2006). In recent years, attention has increasingly been given to the synthesis of benzimidazole derivatives as a source of new antimicrobial agents. The crystal structures of some benzimidazole derivatives *viz.*, 2-chloromethyl-1*H*-benzimidazole nitrate (Jian *et al.*, 2003) and 5-methoxy-1*H*-benzo[*d*]imidazole-2(3*H*)-thione (Odabaşoğlu *et al.*, 2007) have been reported. In view of the importance of benzimidazoles, the title compound, (I), has been synthesized and its crystal structure is reported here.

In (I) the dihedral angle between the mean planes of the benzene and benzimidazoles is 26.2 (6)° (Fig. 1). These groups are slightly twisted around the ethoxymethane structure (C2/C3/O3/C11 torsion angle = 177.64(15)°). Bond distances and angles are in normal ranges (Allen *et al.*, 1987). Crystal packing is stabilized by O—H⋯O, O—H⋯N and N—H⋯O hydrogen bond interactions (Fig. 2, Table 1) involving lattice crystallized water molecules which form a $R_2^2(10)$ graph-set motif (Fig. 3) and a two-dimensional chain along (001). Weak π - π stacking interactions (Table 2) contribute to molecular stability.

S2. Experimental

Ethyl vanillin (0.05 mol) was dissolved in 40 ml of ethanolic KOH (0.05 mol) and the solution was stirred for 1 h. 2-Chloromethyl-1*H*-benzimidazole (0.05 mole) was added with continuous stirring and refluxed for 5 h. The reaction mixture was cooled at room temperature, then poured into crushed ice. The solid product that separated out was filtered off and recrystallized using 1,4-dioxane. Single crystals were grown from ethanol slow evaporation method with a yield of 48%. (m.p.: 366 K). Analytical data: Found (Calculated): C %: 68.87(68.91); H%: 5.39 (5.44); N%: 9.40 (9.45).

S3. Refinement

The H atoms on the water molecules (H1W1, H1W2, H2W1, H2W2, H3W1, H3W2) were originally located in a difference Fourier and then their coordinates were allowed to refine with restraints to keep them in the range of 0.80 - 0.84 Å. The remaining H atoms were then positioned geometrically and allowed to ride on their parent atoms with Atom—H lengths of 0.86 Å (NH), 0.93 Å (CH), 0.97 Å (CH₂) or 0.96 Å (CH₃). Isotropic displacement parameters for these atoms were set to 1.5 times (OH), 1.2 times (NH), 1.2 (CH, CH₂) or 1.5 (CH₃) times U_{eq} of the parent atom. In the absence of anomalous scattering effects Friedel opposites were merged.

Figure 1

Molecular structure of $C_{17}H_{17}N_2O_3$, with 50% probability displacement ellipsoids. Dashed lines indicate $O-H\cdots N$, $O-H\cdots O$ and $N-H\cdots O$ hydrogen bonds.

Figure 2

Packing diagram of the title compound viewed down the c axis. Dashed lines indicate $O-H\cdots N$, $O-H\cdots O$ and $N-H\cdots O$ hydrogen bonds forming a two-dimensional chain along (011).

Extinction coefficient: 0.018 (2)

Special details

Experimental. In the absence of anomalous scattering effects Friedel opposites were merged

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
