Received 4 June 2007; accepted 5 June 2007

Key indicators: single-crystal X-ray study; $T = 296\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$; R factor = 0.038; wR factor = 0.100; data-to-parameter ratio = 10.7.

The molecule of the title compound, $\text{C}_8\text{H}_6\text{N}_2\text{O}$, is almost planar, with a dihedral angle of $0.52(7)^\circ$ between the two rings. In the crystal structure, intermolecular $\text{N}-\text{H}\cdots\text{O}$, $\text{C}-\text{H}\cdots\text{N}$ and $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds and $\pi-\pi$ interactions link the molecules into a three-dimensional network. The $\pi-\pi$ interaction occurs between the pyridazinone and benzene rings of the molecules at (x, y, z) and $(x - 1, y, z)$; the centroid–centroid distance is $3.588(1)\text{ \AA}$ and the plane–plane separation is 3.434 \AA .

Comment

Phthalazines, also called benzo-orthodiazines or benzopyridazines, are a group of heterocyclic compounds isomeric with the cinnolines. The practical interest upon phthalazine derivatives is based on their widespread applications. Phthalazines, like other members of the isomeric diazine series, have found wide applications as therapeutic agents. Phthalazines are also commonly used as ligands in transition metal catalysis, as chemiluminescent materials and for optical applications (Cheng *et al.*, 1999). 2-Substituted-8-(4,6-dimethoxy- pyrimidin-2-yloxy)-4-methylphthalazin-1-one derivatives are used as herbicides. In view of the importance of the title compound, (I), we herein report its crystal structure.

In the molecule of the title compound, (I), (Fig. 1), the bond lengths and angles are within normal ranges (Allen *et al.*, 1987). The rings A (N1/N2/C1/C2/C7/C8) and B (C2—C7) are, of course, planar and they are also coplanar with a dihedral angle of A/B = 0.52 (7)°.

In the crystal structure, intermolecular N—H···O, C—H···N and C—H···O hydrogen bonds (Table 1) link the molecules, in which N—H···O bonds generate the centrosymmetric $R_2^2(8)$ dimers (Etter, 1990), and they are connected by C—H···O and C—H···N bonds to generate the edge-fussed [$R_3^2(8) R_3^3(14)$] ring motifs (Fig. 2). In addition, the three-dimensional network including these motifs are also linked by $\pi\cdots\pi$ interactions, occurring between the $Cg1—Cg2$ rings ($Cg1$ and $Cg2$ are the centroids of rings A and B) of the molecules at (x, y, z) and $(x - 1, y, z)$, with a centroid-to-centroid distance of 3.588 (1) Å and a plane-to-plane separation of 3.434 Å.

Experimental

A pure sample of the compound was obtained from Strides Arco Labs, Mangalore, India and crystallized from DMF (m.p. 528–530 K).

Refinement

H atoms were located in difference syntheses and refined isotropically [N—H = 0.92 (2) Å, $U_{iso}(\text{H}) = 0.078$ (6) Å²; C—H = 0.942 (17)–0.975 (18) Å, $U_{iso}(\text{H}) = 0.063$ (5)–0.079 (5) Å²].

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
---------------------	--

Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.038$	All H-atom parameters refined
$wR(F^2) = 0.100$	$w = 1/[\sigma^2(F_o^2) + (0.0487P)^2 + 0.0889P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.06$	$(\Delta/\sigma)_{\max} < 0.001$
1324 reflections	$\Delta\rho_{\max} = 0.12 \text{ e } \text{\AA}^{-3}$
124 parameters	$\Delta\rho_{\min} = -0.16 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
