Key indicators

Single-crystal X-ray study
 $T = 120$ K
Mean $\sigma(\text{C}-\text{C}) = 0.005$ Å
 R factor = 0.061
 wR factor = 0.165
Data-to-parameter ratio = 11.9For details of how these key indicators were automatically derived from the article, see <http://journals.iucr.org/e>.

In the title compound, $\text{C}_{14}\text{H}_{12}\text{N}_2\text{O}_4$, there is an inversion centre at the mid-point of the ethylene bridge. The nitro group is inclined at an angle of $33(2)^\circ$ to the plane of the phenyl ring. The benzene rings in each molecule are coplanar, but the dihedral angle between the benzene rings in neighbouring molecules is $55.2(1)^\circ$.

Comment

The title compound, (I), is an intermediate in the syntheses of the anticonvulsant drugs carbamazepine and oxcarbazepine, and also the antidepressant drugs imipramine and desipramine. The Cambridge Structural Database (Version of Aptil 2004; Allen, 2002) reveals that there are currently eight known crystal structures of 2,2'-disubstituted dibenzyls, including derivatives with substituents such as bromo, methyl and methoxy groups, but not nitro. In the title compound (Fig. 1), there is an inversion centre at the mid-point of the ethylene bridge. Thus, the molecule adopts a stepped *trans* conformation with respect to the benzene rings and nitro groups, respectively. The nitro group is inclined at an angle of $33(2)^\circ$ to the plane of the benzene ring. The benzene rings in each molecule are coplanar, but the dihedral angle between the benzene rings in neighbouring molecules is $55.2(1)^\circ$.

Experimental

The title compound was obtained from Max India Ltd and crystals were grown from ethanol.

All H atoms were included in the refinement at calculated positions, with C–H distances of 0.95 (aromatic H atoms) and 0.99 Å (CH₂ H atoms), and refined as riding, with $U_{\text{iso}}(\text{H}) = 1.25U_{\text{eq}}(\text{carrier atom})$. The high R_{int} is the result of weak high-angle data.
