Key indicators: single-crystal X-ray study; $T = 100$ K; mean $\sigma(\text{C}-\text{C}) = 0.001$ Å; R factor = 0.030; wR factor = 0.089; data-to-parameter ratio = 21.6.

In the title compound, $\text{C}_{11}\text{H}_{11}\text{ClN}_4\text{O}_3\text{S}$, the S atom is bonded in a distorted tetrahedral geometry, by two O atoms, a C atom of the benzene ring and an amino N atom. The essentially planar pyrimidine ring [maximum deviation = 0.020 (1) Å] forms a dihedral angle of 87.57 (5)° with the benzene ring. In the crystal structure, pairs of molecules are linked by intermolecular $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonds to generate centrosymmetric $R_2^2(8)$ ring motifs. In addition, molecules are linked into a three-dimensional extended network by intermolecular $\text{N}-\text{H}\cdots\text{N}$, $\text{N}-\text{H}\cdots\text{O}$ and $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds.

4-Amino-*N*-(6-chloro-5-methoxypyrimidin-4-yl)benzenesulfonamide**Hoong-Kun Fun, Jia Hao Goh, C. S. Chidan Kumar, H. S. Yathirajan and B. Narayana****S1. Comment**

The importance of pyrimidines and analogous compounds in pharmaceutical and biological fields is well known (Townsend *et al.*, 2002). Some substituted pyrimidines and their derivatives have been reported to possess anti-microbial and anti-fungal activities (El-Hashash *et al.*, 1993). Pyrimidines have incidental anti-viral activity against herpes and vaccinia infections (Calabresi *et al.*, 1975). A review on pyrimidines as anti-inflammatory agent is described by Amir *et al.* (2007). Sulfonamides are an important class of anti-bacterial drugs used in medicine and veterinary practice. Sulfa drugs are widely used in the treatment of infections, especially for patients intolerant to antibiotics. The vast commercial success of these medicinal agents has made the chemistry of sulfonamides to become a major area of research and an important branch of commercial importance in pharmaceutical sciences (Nagaraja *et al.*, 2003). In view of the importance of the title compound possessing potential anti-bacterial properties, its crystal structure is reported herein.

In the title sulfonamide compound (Fig. 1), the geometry around the S1 atom is a distorted tetrahedron, comprising of atoms O1 and O2 of the sulfonyl group, C6 atom of benzene ring and the amino atom N2. The O1–S1–O2 and O2–S1–N2 angles are 119.20 (5) and 102.20 (4)°, respectively, and the C6–S1–N2–C7 torsion angle is -68.95 (9)°. The pyrimidine ring is essentially planar, with r.m.s. deviation of -0.020 (1) Å, and is almost perpendicular to the benzene ring (C1–C6), as indicated by the dihedral angle of 87.57 (5)°. The bond lengths (Allen *et al.*, 1987) and angles are within normal ranges and are comparable to a related structure (Chohan *et al.*, 2008). In the crystal structure, pairs of intermolecular N2—H1N2···O2ⁱⁱⁱ hydrogen bonds (see Table 1 for symmetry code) generate $R^2_2(8)$ ring motifs (Bernstein *et al.*, 1995). Neighbouring molecules are linked into a three-dimensional extended network by intermolecular N1—H1N1···N4, N1—H2N1···O1 and C4—H4A···O1 hydrogen bonds (Fig. 2).

S2. Experimental

The title compound was obtained as a gift sample from R. L. Fine Chem, Bangalore, India. The compound was used without further purification. Single crystals of good quality were obtained from slow evaporation of an acetonitrile solution. *M.p.* 447–450 K.

S3. Refinement

All the H atoms were located in a difference Fourier map and allowed to refine freely [range of C—H = 0.90 (2) - 0.991 (19) Å].

Figure 1

The molecular structure of the title compound, showing 50% probability displacement ellipsoids for non-H atoms and the atom-numbering scheme.

Figure 2

Part of the crystal structure of the title compound, viewed along the *c* axis, showing a three-dimensional extended network. H atoms not involved in intermolecular hydrogen bonds (dashed lines) have been omitted for clarity.

Special details

Experimental. The crystal was placed in the cold stream of an Oxford Cyrosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1)K.

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of *F*² against ALL reflections. The weighted R-factor *wR* and goodness of fit *S* are based on *F*², conventional R-factors *R* are based on *F*, with *F* set to zero for negative *F*². The threshold expression of *F*² > 2σ(*F*²) is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on *F*² are statistically about twice as large as those based on *F*, and R-factors based on ALL data will be even larger.
